

Continueu

- 0–2 years, with one thing you've built that proves depth — a project, paper, competition (Kaggle, ICPC, research), or portfolio. We care more about how deep you went on one thing than how many things you've touched.
- Strong programming fundamentals — data structures, algorithms, complexity. You can reason about why your code is correct and what it costs.
- Strong ML Fundamentals. You can explain how the methods you've used actually work.
- Bias to action. Fast iteration, low ego, comfortable being wrong quickly and moving on.
- Bonus: hands-on with 3D, computer vision, or geometry — point clouds, multi-view geometry, camera models, SLAM, registration, anything in this space.
